

Module 3 Summary: Creating AI Application and Deploy using Flask

Congratulations! You have completed this module. At this point, you know that:

- Watson AI libraries are embeddable libraries that are preinstalled in the Cloud IDE framework. These embeddable AI libraries provide a variety of NLP and speech-based functions based on popular AI models.
- In the projects, you developed web apps with incorporated AI functionality using IBM Watson libraries.
- Both projects followed the same application creation steps including:
 - Create a function for the application
 - Package the application function
 - Run unit testing of the function by calling it as a package
 - Deploy the application over the web using Flask
 - Incorporate Error handling to the application
 - Run static code analysis on the codes created
